```
Result: Sorted array A
  procedure MERGE\_SORT(A)
       if |A| \leq 1 then return
       mid \leftarrow |A|/2
       A_l \leftarrow [A_1, A_2, ..., A_{mid}]
      A_r \leftarrow [A_{mid+1}, A_{mid+2}, ..., A_{|A|}]
       Merge\_Sort(A_l)
       Merge\_Sort(A_r)
       Combine(A, A_l, A_r)
       return
Input: Original array A, sorted arrays L and R of A corresponding to left
and right subarrays of A
Result: L and R combined into A to form a sorted array A
  procedure Combine (A, L, R)
       l \leftarrow 0
                                                     ▶ Here, we use 0-based indexing
       r \leftarrow 0
       i \leftarrow 0
                                                                    \triangleright Index for array A
       while l < |L| \text{ OR } r < |R| \text{ do}
           if (l < |L|) AND (r \ge |R|) OR L[l] \le R[r]) then
               A[i] \leftarrow L[l]
               l \leftarrow l + 1
           else
               A[i] \leftarrow R[r]
               r \leftarrow r + 1
           i \leftarrow i+1
       return
```

Input: Array  $A = [a_1, a_2, ..., a_n]$ .
